2520030174 - P.Nehasree

2520030282 - P.Hasini

Introduction

01

Digital transformation of event planning and ticket booking

02

Enables organizers to create, manage, and monitor events seamlessly

03

Provides users with a smooth, secure, and real-time ticket booking experience

04

Built using modern full-stack technologies for scalability and reliability

Abstract

Eventify provides an efficient platform for event discovery, user registration, online ticket booking, and QR ticket generation. It allows organizers to manage event information and booking data using React.js, FastAPI, and MySQL.

Problem Statement

Manual event booking is time-consuming, prone to errors, and difficult to track. Managing event information and paper-based tickets can also create difficulties for organizers and attendees. Eventify provides a centralized digital solution.

Modules

CO1:Entity-Relationship Modelling and Schema Design –

used for the Users, Events and Bookings database and their relationships.

CO2: SQL Database Engineering –

used with MySQL to store and manage user, event and booking data.

Modules

CO3:FastAPI RESTful API Design and Authentication –

used between React.js and FastAPI for authentication, events, bookings and QR generation.

CO4: Multi-Framework Backend Engineering –

used in the FastAPI backend for user authentication, event management, booking and QR code generation.

Modules

CO5:Microservices Engineering — related to the separate React.js frontend, FastAPI backend and MySQL database shown in the system architecture.

CO6:Deployment, Observability & Delivery — reflected through the system architecture, database design, implementation screenshots, results and testing, and project conclusion.

Hardware Requirements

Component	Minimum Requirement
Processor	Dual-core processor, 2.0 GHz or higher
Client device	Computer, tablet, or smartphone
Network	Stable internet connection
Scanner	Smartphone camera or QR-code scanner for ticket verification.

Software Requirements

01

Frontend: React.js for a fast, component-based, responsive UI.

02

Backend: FastAPI (Python) for backend services and RESTful API communication.

03

Database: MySQL for structured storage of users, events, orders, and transactions

04

Ticket Validation: Auto-generated unique QR codes generated for each successfully booked ticket.

Conclusion

The Event Management and Ticketing Platform provides an efficient solution for organizing events and managing ticket sales. By combining event publishing, online booking, secure payment, digital ticketing, notifications, and attendance tracking in one system, it reduces manual work and improves accuracy.

Thank You.
